Northern New Mexico Highlights Capstone Project CNM Deep Dive Bootcamp Project Summary

The main objective for this project is to be able to have information on the place visiting saved to your device even when service is not available. Such as when visiting the Northern NM Mountains. The app allows the user to use a map for finding and sorting out different place types in the area, interested in visiting.

This information found by searching the place type can be saved, to the device by favoriting a location or a landmark.

With this app you should be able to use the map and search for a place by a "place-type", or the name of the place you want to visit. If you search for a place-type, a list of places will show that are associated with the place types you enter into the search field/ or using the dropdown button to see a list of available place types, giving you information about the specified place once you click on one single place.

If you like a place, you can also favorite this place and save it's information into the database for later so that when you're offline, you will be able to access this information still.
